Claim 5; Fig 1; 64pp; English.

The CDNA is derived from messenger RNA isolated from a mouse T-cell line after activation with concanavalin A. The cDNA was cloned by incorporation into a plasmid vector, which then transformed into E.coli. The plasmid vector also contained DNA segments from the SV40 virus, permitting expression of the CDNA after transfection into a mammalian host cell, such as monkey COS-7 cells. The polypeptide includes a potential leader sequence of about 19 AAs.

PT Interleukin-13 useful to treat asthma, allergy or condition

PT exacerbated by 19E production

PS Example 2; Page 56; 93pp; English.

CC Using PCR, a derivative of novel haemoprotein receptor NR4 cDNA was

generated which encoded the interleukin-3 signal peptide (W09823)

and an N-terminal FLAG epitope tag (W09824) preceding the mature

1 The Thra7-Pro424) of murine NR4 (see also W09821). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RRESOLUTION OF THE PRINCIPAL OF THE PRIN

Mammalian expression vector per-BOS was engineered to contain DNA for the IL-3 signal sequence and for a FLAG epitope. PCR fragments (see also T60970-72) coding for mature or soluble NLERK2 (see also W10637), a novel ligand for eph kinase (LERK), were cloned into the vector to allow prodn. of sequence 30 AA;
                                     27-FEB-1997;

PM New isolated haemopoietin receptor - used for developing products

PM New isolated haemopoietin receptor - used for developing products

PM of modulating proliferation, differentiation and survival of cells,

PM e.g. neuronal cells

Claim 29(1); Page 54; 182pp; English.

CC The mouse IL3 signal sequence was used to study the expression of mouse

CR R6.1. NR6.1 is a form of NR6 a novel Haemopoietin receptor (HR).

CC Interaction between the novel HR and a ligand facilitates proliferation,

CC differentiation and survival of a wide variety of cells. The HR and it's

CC derivatives can be used for modulating the activity of the receptors e.g.

CC different cells and tissues in vitro and in vivo. They can be present in

CC and survival. The products can also be used for detection and diagnosis,

CC e.g. for cancers or predisposition to cancers, or for drug screening.

Example 14; Page 52-53; 69pp; English.

The II-13 binding protein and related therapeutic molecules can be used in the antagonism of at least one II-13 activity. They can be used for treating II-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered II-13 after II-13 after II-13 after II-13 conditions of the products can also be used as diagnostic agents, e.g. for immunotherapy and may also be used as a diagnostic tool.

                                                                                                                                                                                                                                                                                                                                                                                                      receptors can be used in a novel, claimed method of screening for compounds which modulate the binding of a Wnt polypeptide (secreted proteins involved in cell-to-cell signalling) to a Wnt receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         This protein comprises the Drosophila frizzled-2 protein encoded the Drz2 gene (see 189885). It is a receptor for wingless (Wg), acting as a signal transducing molecule, and is an example of a receptor (WntR). Other novel frizzled family members have been identified in human, mouse and Caenorhabditis elegans (see w31268-74) and are considered also to be Wnt receptors. Wnt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Misc_difference

determining HAPO167 protein levels. HAPO167 proteins can be used to screen for agonists and antagonists which bind to the protein. These can be used in treatment to activate (agonist) or inhibit (antagonist) can be used in treatment to activate (agonist) or inhibit (antagonist) can be used in treatment to activate (agonist) or inhibit (antagonist) can be used in treatment to direct administration of antisense conditions associated with a lack of HAPO167 protein. Gene therapy may also be used to affect endogenous HAPO167 protein production. HAPO167 antibodies are useful for inducing an immune response to immunise and correct against diseases, and for isolating HAPO167 clones or purifying the protein by affinity chromatography. HAPO167 proteins can be administered directly or as a vaccine to inoculate against disease. CC Diseases diagnosed, prevented or treated include: infections caused by Enseases diagnosed, prevented or treated include: infections caused by HIV-1 or -2; pain; cancer; bulinia; asthma; parkinson's disease; acute casteoporosis; angina pectoris; myocardial infarction; ulcers; allergies; benign prostatic hypertrophy; and psychotic and neurological disorders; including delixium, anxiety, schizophrenia, manic depression, dementia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

HAPO167 proteins and polynucleotides are useful for diagnosing susceptibility to diseases by detecting mutations in the HAPO167 gene, and can diagnose diseases associated with HAPO167 imbalance by determining HAPO167 protein levels. HAPO167 proteins can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is represents a Bacillus thuringiensis toxin which is active against lepidopteran pests. The toxin isolates can be used for the control of lepidopteran pests such as Agrotis ipsilon (black cutworm), Heliothis virescens and Helicoverpa zea. PCR primers and probes can be derived from the polynucleotide encoding the toxin and used for the amplification and detection of other toxin-encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SS
                                            protein. HAPO167 proteins and polynucleotides are useful for diagnosing cand can diagnose diseases by detecting mutations in the HAPO167 gene, and can diagnose diseases associated with HAPO167 imbalance by determining HAPO167 protein levels. HAPO167 proteins can be used to screen for agonists and antagonists which bind to the protein. These can be used in treatment to activate (agonist) or inhibit (antagonist) can be used to response to prevent expression, or HAPO167 protein. Gene therapy may called the sequences to prevent expression, or HAPO167 protein. Gene therapy may called be used to affect endogenous HAPO167 protein. Gene therapy may called be used to affect endogenous HAPO167 protein. Gene therapy may called be used to affect endogenous HAPO167 protein. Gene therapy may called be used to affect endogenous HAPO167 protein. Gene therapy may called be used to affect endogenous HAPO167 protein production. HAPO167 called and protein by affinity chromatography. HAPO167 clones or purifying the protect against disease, and for isolating HAPO167 clones or purifying chamiltered directly or as a vaccine to inculate against disease. Diseases diagnosed, prevented or treated include: infections caused by HAPO167 callude: hypotension; bypertension; urinary retention; osteoporosis; angina pectoris; myocardial infarction; ulcers; allergies; benign prostatic hypertrophy; and psychotic and neurological disorders, including delirium, anxiety, schizophrenia, manic depression, dementia, severe mental retardation and dyskinacias, manic depression, dementia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

      DNA, ligands, antibodies, etc Claim 1; Page 42-44; 65pp; English.

This sequence represents a human G-protein coupled receptor of the invention. The protein or cells expressing the DNA encoding it can be used to screen for agonists or antagonists of the receptor, which can be used as drugs for treating various diseases (none disclosed). The DNA can also be used for practice drug design based on comparisons with extructurally analogous ligands and receptors. DNA encoding the protein can be used for gene therapy for diseases caused by a deficiency of the receptor. The DNA can also be used to detect abnormalities in the gene encoding the receptor. The protein or fragment can be used to determine levels of receptor ligands in vivo. The antibody can be used in assays to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Breast cancer genes - used to develop products to design or screen diagnostic reagents or therapeutic compounds Claim 17; Fig 24; 118pp; English.

W58774-W58804 are translated protein fragments from the novel human breast cancer gene, CH9-2all-2 isolated from a 3.5 kb DNA fragment. This fragment can be used for identifying genes and gene products that are intimately related to malignant transformation or maintenance of the malignant properties of cancer cells. It can also be used to design or screen diagnostic reagents or therapeutic compounds. Kits are included within the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chen L, Smith H; WPI; 97-512705/47.

                                                                                                                                                                                                             and over expresses at least one gene coding for a protein that mediates cellular clearance of antibiotics or other substances that are toxic for the microorganism. A process is described for producing L-cysteine, in which intracellularly produced L-cysteine reacts with an intracellular ketone or aldehyde in a microorganisms to form a thiazolidine derivative. The thiazolidine derivative is secreted from the microorganism by means of a protein that mediates cellular clearance of antibiotics or other substances that are toxic for the microorganism, and optionally after separating the thiazolidine derivative. L-cysteine is recovered by equilibrium displacement of the reaction equilibrium between L-cysteine and the thiazolidine derivative in the direction of L-cysteine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 5; Page 16-17; 33pp; German.

This sequence is a fragment of an antibiotic efflux protein from Escherichia coli strain K12 which is used an a method resulting in a novel microbial strain which is suitable for the fermentative production of L-cysteine, L-cystine, N-acetyl-serine and/or thiazolidine derivatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 resistance (mar) operon. Antisen mar operon can be used to lower antibiotics.

Title: US-09-037-657-32 Perfect score: 139

1 MVLASSTTSIHTMLLLLLMLFHLGLQASIS 30

Scoring table: BLOSUM62

Sequence:

hed: 122810 seqs, 40065486 residues

Database : PIR_60:* 1: Pir1:* 2: Pir2:* 3: Pir3:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Title: Perfect score: Sequence: US-09-037-657-32 139

MVLASSTTSIHTMLLLLLMLFHLGLQASIS 30

Scoring table: BLOSUM62

Searched: 77977 seqs, 28268293 residues

Database : SwissProt_37:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

I- FUNCTION: GRANULOCYTE/MACROPHAGE COLONY-STIMULATING FACTORS ARE CYTOKINES THAT ACT IN HEMATOPOLESIS BY CONTROLLING THE PRODUCTION, DIFFERENTIATION, AND FUNCTION OF 2 RELATED WHITE CELL POPULATIONS OF THE BLOOD, THE GRANULOCYTES AND THE MONOCYTES-MACROPHAGES.

-I- FUNCTION: THIS CSF INDUCES GRANULOCYTES, MACROPHAGES, MAST CELLS, STEM CELLS, ERYTHROID CELLS, EOSINOPHILS AND MEGAKARYOCYTES.

-I- SUBUNIT: MONOMER.
-I- SISSUE SPECIFICITY: ACTIVATED T CELLS, MAST CELLS, NATURAL KILLER.

                                                                                                                                                                                                              FUNCTION: NEGATIVE REGULATOR OF MITOSIS IN E.NIDULANS. THIS PROTEIN IS PART OF A REGULATORY PATHWAY THAT INCLUDES THE NIMA PROTEIN KINASE. IT IS REQUIRED TO PREVENT PREMATURE ENTRY INTO MITOSIS. MUTATIONS TO THES PROTEIN BOTH CAUSE CELLS TO ENTER MITOSIS AND PREVENT THEM FROM LEAVING MITOSIS.
